

BG-9 Wildlife Guard

Description:

The BG-9 is a wildlife guard which is installed on the bushings of transformers and other power equipment. It covers the lead wire and electrical connections to the bushings and prevents contact by birds and squirrels. The BG-9 is molded using proprietary, gray, track/ultraviolet resistant, high density polyethylene.

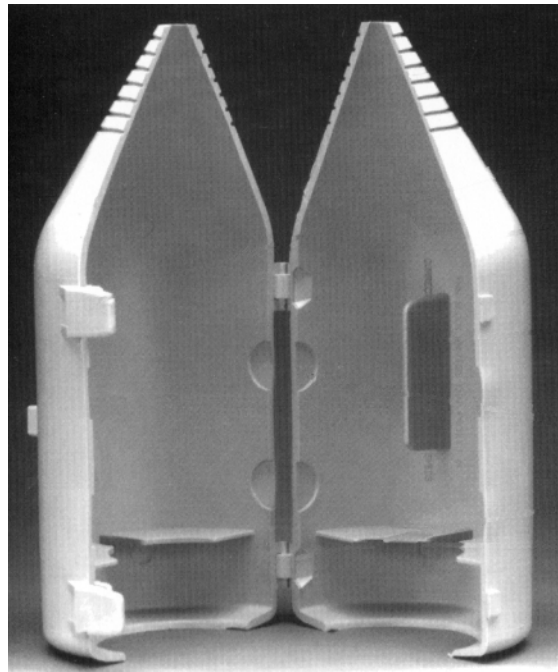

Benefits:

- Prevents harm to wildlife
- Prevents outages, improves circuit reliability
- Installs quickly and easily
- Scored top for easy conductor fit (including current limiting fuse)
- Clasps close easily and stay latched
- Vertical internal block ensures proper installation (patent pending)
- Rugged molded hinges

Application:

The BG-9 Wildlife Guard is equipped with horizontal internal supports which provide stability when the guard is mounted over the top skirt of the bushing. The guard is designed with double knockouts for direct-connected surge arresters. Knockouts are also provided for spark-gap arresters. The BG-9 is designed to be installed without removing the lead wire from the bushing connector, thus allowing installation on energized equipment with live line rubber gloves.

Catalog Number	Maximum bushing fin diameter (inches)	Outside Diameter (inches)	Height (inches)	Weight (lbs)
